

VMConnector Web Services for VirtueMart / Joomla! (Mambot)

Français: Español: Italia: Português: Nederland: Chinese: Russian: Deutsch: VMConnector:

- Is a complete solution which allows you to manage right away your Virtuemart shop directly from your MS Excel spreadsheets (no CSV files) using our open source VMCCClient (vb.net) for VMConnector.

- Is also a fully customizable and programmable web services interface to and from Virtuemart, this allows you to build your own clients (PHP, Java, Python, ...) for specific OS (operating systems: Mac, Linux, ...), and manage or automate your shop maintenance with existing accounting systems or product databases. Managing your Virtuemart product catalog and sale orders has never been that Fast & Easy! Buy VMConnector for 95 € only! It will never expire and save you hours of manual work! Unlimited user access for one domain license (i.e. www.myshop.com)

FREE UPGRADE FOR ONE FULL YEAR!!

(VMConnector is UTF-8 encoding compatible)

Who are our VMConnector customers?

-

B2B (Business to Business): All solution providers and integrators who want to enrich their current VirtueMart offers with automation & integration possibilities.

VMConnector is a set of Web services for Virtuemart which enables client / server integration model between your VM eCommerce and your existing databases/systems (products, accounting). Other VMConnector client interfaces can be easily built for additional operating systems like Mac, Linux...

-

B2C (Business To Customers): End users can either work directly through our VMCCClient and MS Excel without using complex CSV to manage their VM product catalog and sale orders or even extend and customize the VMCCClient interface (open source).

VMConnector, what is it?

-

The VMConnector extension is the server part which installed on your Website with Joomla and Virtuemart.

As you cannot connect directly to your Joomla Virtuemart database (MySQL), VMConnector enables connections through http and https from your local client databases and programs (accounting, products, ...).

VMConnector exposes Web services functions which can be called directly and from your local applications to manage mass updates or data collections (VM catalog management, sales order processing).

-

The VMCCClient is a full functional client (.NET open source) which comes along with the VMConnector package to call the VMConnector web services functions on your web site. Once the data are retrieved into the VMCCClient, you can export it directly into an MS Excel spreadsheet or connect it to your own product databases and applications.

Many other client programs can be developed for other operating systems like Mac or Linux (PHP client samples available from our web site).

(What are the main VMConnector differences with competition? Please check this (FAQ)).
